JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

XLI. *Observations on the Comet seen in January 1760; by James Short, M. A. F. R. S. In a Letter to the Rev. Tho. Birch, D. D. Secretary to the Royal Society.*

Dear Sir,

Surry-Street, 10 Jan. 1760.

Read Jan. 10,
1760.

A Comet has made its appearance near the constellation of Eridanus, a little to the westward of Orion. Last night I took its transit over the meridian, and likewise its declination. Its nucleus is small, subtending an angle of not more than 5 or 6 seconds, but very visible thro' a two feet reflector magnifying about 70 times. Its motion is to the westward, with a considerable velocity, seemingly about 2 degrees in a day; for, about an hour and a half after I had taken its transit, I judged it had advanced about 10 or 12 minutes; which I find to be about the rate of the great comet, when it first was seen in the end of the year 1743. This comet is very visible to the naked eye, tho' I could perceive nothing of a tail; and therefore I conclude it is going down to the sun.

Comet passed the meridian 9th January	} Mean time.
1760, at - - - - -	
Its declination south - - - - -	9 ^h 8' 53"
Rigel Orionis passed the meridian at -	9 ^h 47' 49"

I am, Dear Sir,

Your most humble servant,

Ja. Short.
